

HOME CARE AFTER LASER GUM TREATMENT

1

Congratulations on taking the next step to get your mouth healthy!

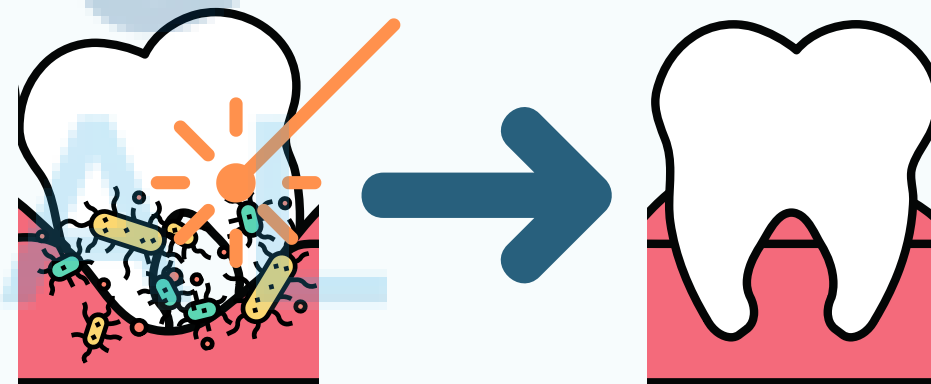

- Laser therapy is the most advanced dental technology for the health of your gum tissue.
- Laser kills bacteria that causes gum disease and reduces bleeding, inflammation, and pocket depths.

2

No flossing or using Waterpik for the next 3 days.

The laser helps your healthy gum reattachment to your teeth.

3

No using Chlorhexidine/peridex mouth rinse

Chlorhexidine particles interrupt the gum reattachment process. We want your healing process to be successful!
